

You are Not Alone – YANA 0318

March 2018, London.

Sponsored by

NBCUniversal

Hosted by

BBC | Research & Development

Summary

Nearly 50 industry experts participated in the day-long discussion of modern networked video technologies, raising awareness of issues and progress in each others' areas of the industry, showcasing new technology developments, and building important connections for onward work.

Participants represented diverse corners of the IP video industry:

- Content developers
- Content providers
- Digital & Broadcast Network operators
- Equipment manufacturers
- Researchers

YANA – Purpose

New ideas for creating, delivering, and consuming video content often leverage and repurpose existing standards while cutting across traditional standards organization boundaries and leaving proponents feeling isolated and unheard. Meanwhile traditional standards organizations can be limited to developing standards within the boundaries defined by their scopes, and they may not even be aware of the ways their work is being used and extended, or of the unique needs of these new adopters.

YANA was conceived to bring together a diverse group of experts from a wide swath of the (IP-based) video industry, to build new connections, strengthen relationships, and lay the groundwork for improved coordination in developing technologies and standards going forward.

Evolving Industry Complexity

Video technology encompasses much more today than it did 25 years ago. As a result, the industry is much broader, and the standards landscape is much more complex.

Television, circa 1994

Home video viewing, today

And, the standards landscape has grown commensurately.

1994

Connectivity
<ul style="list-style-type: none">•Component: EIA-770.1 (analog NTSC typically using 3 wires - YP_BP_R)•Composite: EIA/RS-170A (analog baseband NTSC composite video)•Coax: 75 ohm modulated RF NTSC•Remote Control: IR - Proprietary
Encoding
<ul style="list-style-type: none">•NTSC: Broadcast standard for analog TV•NTSC-J: Broadcast standards for analog TV in Japan•PAL: Broadcast standard for analog 625 line/50 Hz systems used in most of Europe and parts of Asia, South America and elsewhere•SECAM: Broadcast standards for analog TV originating in France but used in other areas as well.

Today

<p style="text-align: center;">Connectivity</p> <ul style="list-style-type: none"> •HDMI: CEA 861-F <ul style="list-style-type: none"> •CEC (Consumer Electronics Control) •ARC (Audio Return Channel) •HEC (HDMI Ethernet Channel) •HDCP: High Definition Content Protection (over HDMI) •Wi-Fi: IEEE 802.11a/b/g/n/e... •Ethernet: IEEE 802.3 •S/PIDF (Optical Port): IEC 60958 type II •Remote Control <ul style="list-style-type: none"> •IR: RC-5/6 (Philips); NEC; proprietary •RF: RF4CE (ZigBee), Bluetooth LE; low power Wi-Fi 	<p style="text-align: center;">Network & Transport</p> <ul style="list-style-type: none"> •IPv4/IPv6 •IP Multicast •TCP •UDP •HTTP/HTTPS •HTML & MSE •HTTP progressive download •MPEG Dash/CFE •HLS streaming (Apple) •Smooth Streaming (Microsoft) •HDS steaming (Adobe) •RCSF •DivX Plus Streaming technology •ASF •MPEG-2 TS •MPEG2-PS •HTML5 •RTSP •RTCP •RTP •TLS •WebRTC •DLNA •UPnP

<p style="text-align: center;">Others</p> <ul style="list-style-type: none"> •CEA-708B: Closed Captioning •TTML10 (W3C): Closed Captioning 	<p style="text-align: center;">Content Identification</p> <ul style="list-style-type: none"> •EIDR

Discussion through the day focused in 3 main topic areas:

- Technology
- Current Standards Work
- Industry Uptake and Projections

The following sections outline some of the highlights from the day. Many of the presentations are available publicly online – you can find them from the thumbnail sketches in the Available Meeting Materials section at the end of this report.

Technology

The meeting featured demonstrations and discussions of new technologies for packaging and delivering video.

New creations are feasible with multiple concurrent video sources (e.g., phones) and by blending parts of the process from creation to storage to delivery of a “production”. Richard Cartwright presented an Agile Media Blueprint, leveraging an Internet technology mindset for supporting such collaboration and provided a demonstration.

Further leveraging Internet technologies, Gaurav Naik and Éric Vyncke demonstrated two separate proposals using IPv6 addresses for content addressing and dynamic routing for content delivery. Chief points of discussion focused on the impact of

encryption (not an issue if manifests are not rewritten), privacy and most efficient integration with caching. In advanced research, Giovanna Carofiglio discussed and demonstrated the delivery of mobile video over hybrid ICN (Information Centric Networking implemented on non-disruptive technology).

Current Standards Work

Several updates on standards work from participants in different fora were offered.

Chris Needham outlined the current work on media APIs being developed at the W3C, as well as that organization's extensive roadmap for web support of video – from live linear content media source extensions to cloud browsers, and everything in between.

Ori Finkelman provided an update on the SVA Open Caching work, which is focused on writing specs and working with the IETF to extend CDNI for standards. A goal is to see ISP edge caching become a reality.

Ali Begen outlined the work of DASH and the Content Media Application Format (CMAF) – both ISO standards work. The room discussed uptake of CMAF, and Ali outlined upcoming priorities of the DASH/CMAF work.

Industry Uptake and Projections

Several of the discussion topics focused on industry uptake of technologies and general industry perspective on requirements.

As web-based delivery of video becomes more popular, more efficient delivery is imperative. Richard Bradbury outlined BBC's work with multicast HTTP over QUIC, especially for use in high popularity realtime events. Lucas Pardue demonstrated their implementation, highlighting its value in low latency situations.

Matt Green outlined some of the challenges of a large ISP delivering video content through multicast, while using 3rd party caching services.

Looking forward in the industry, Guillaume de St Mark and Peter Brightwell provided complementary perspectives on requirements for the future – bringing together the disparate groups focused on standards and technology development to meet the needs of this burgeoning use of the Internet. Usage of the Internet is only going to increase, and we must work together to find solutions to the scaling issues faced today.

Wrap up

Key takeaways for participants included perspective and insight on aspects of video industry beyond their normal scope of observation and engagement.

There was general support for, and interest in, a follow on meeting to delve into topic areas more deeply and continue developing the relationships established at the meeting.

Available Meeting Materials

Overview of Media Technologies on the Web

BT Network Caching

Caches installed in:
3 Central London sites
9 Regional sites

We are looking to drive caches deeper:
94 Metro sites
~1000 Access sites

BT Content Delivery

Matt Green (BT)

Overview of content caching and multicast video delivery within the BT network

<https://yana.techark.org/wp-content/uploads/2018/03/BT-Caching-and-Multicast.pdf>

Edge caching

- Caching at the ISP edge solves all the above
- So why don't we have more networks looking like this?

- Network ownership
- Incompatible technologies
- Legal and regulatory reasons (e.g. net-neutrality)

© 2018 Streaming Video Alliance

Open Caching

Ori Finkelman (Qwilt)

Highlights and status of Streaming Video Alliance work to develop open caching services for better ISP-Content delivery

<https://yana.techark.org/wp-content/uploads/2018/03/yana0318-open-caching.pdf>

Content-Aware Streaming with CBR-Encoded Content
 Delivers the Highest Quality for a Given Bitrate Budget

DASH/CMAF Activities

Ali C. Begen

Provides an update on DASH and CMAF developments; evolving Content Aware Streaming (variable bit rates / clients and conditions)

To the rescue – the #AgileMediaBlueprint

- New plan for how to use *The Platform* end-to-end
 - Object stores, fast networks (>10Gbps), uber-caches, microservices
- A continuum from production through to delivery
 - New creative opportunities – break down the walls of the facility
- ~~Go beyond~~ file-based = tape-based workflow with files!

Agile Media Blueprint

Richard Cartwright (*StreamPunk*)

Describes a new approach: breaking media into many very small pieces that can be handled separately but synchronized – builds off film concept, but digital.

https://yana.techark.org/wp-content/uploads/2018/03/AMB_small.pdf

6CN Advantages – High Availability, Monitoring

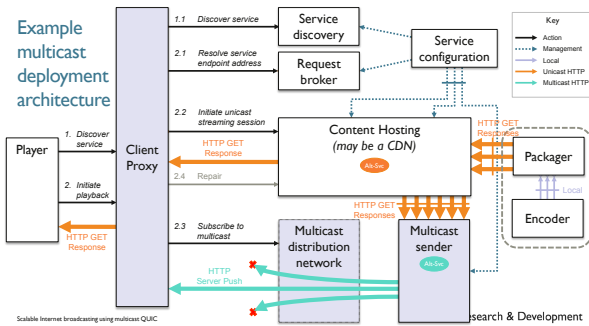

6CN: Content Networking with IPv6, <http://6cn.io>

Eric Vyncke (*Cisco*)

Using IPv6 addresses to label chunks of video, leveraging network routing to improve performance

Scalable Internet broadcasting using multicast QUIC

Richard Bradbury and Lucas Pardue (BBC)

Discussion and demo of using multicast QUIC over HTTP for building a scalable IP-based TV distribution system

<https://yana.techark.org/wp-content/uploads/2018/03/YAN0318-Scalable-Internet-broadcasting-using-multicast-QUIC-2018-03-16.pdf>

What is required for continuing successful standardisation

- ▶ ISO/IEC should allow the development of international standards that satisfy one business model freely adopted by MPEG
- ▶ MPEG should have the means to remove patented technologies from a standard if the patent holder does not wish their technology to be used in support of the adopted business model
- ▶ This is no innovation, it is just about recreating the situation of 30 years ago when each committee operated according to the shared business models of the industries populating it

MPEG standards: successes and threats

Leonardo Chiariglione (presented by Ali C. Begen)

Challenges with MPEG standards development, funding and IPR policies.
